ROADMAP

General roadmap for Smogon University mobile application :

1. Define the purpose and goals of the forum: What do you want the forum to achieve? Who is the target audience? What topics will be discussed on the forum?

2. Create a technical specification document: This document should outline the technical requirements for the forum, including the features that you want to include, any integrations that you need, and any technical constraints that you have.

3. Create a backlog: A backlog is a list of all the tasks that need to be completed in order to build the forum. This should include everything from design and user experience to database design and code development.

4. Design the user experience: This includes creating wireframes and mockups of the user interface, as well as determining the overall flow of the app.

5. Design the database: Determine what data you need to store and how it should be structured. This may involve creating entity-relationship diagrams to visualize the relationships between different data entities.

6. Write the code: Use a programming language like Java or Kotlin to write the code for the forum. This may involve using a framework like React Native to build the front-end, and a backend technology like Node.js or Rails to build the server-side logic.

7. Test and debug the forum: Thoroughly test the forum to ensure that it is functioning as expected and fix any issues that arise.

8. Launch the forum: Once the forum is complete and has been thoroughly tested, it's time to launch it! Be sure to promote the forum to your target audience and encourage participation.
